PVC (KG)
PIPES

WE ARE

a private company Peštan, leader in the Balkans in the production and distribution of products and solutions from the polymers.

Company was founded in 1989 and has been producing water pipes made of polyethylene. Over time, we introduced new materials (polypropylene and PVC) and expanded product range. Today, in our offer you may find more than 8.500 products, divided into four categories:

PIPING
SOLUTIONS

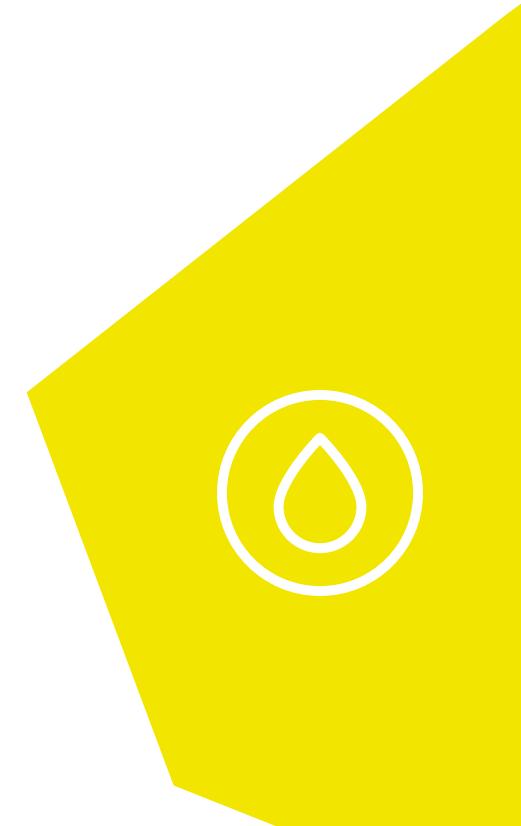

BATHROOM
SOLUTIONS

AGROCULTURE
SOLUTIONS

HOUSEHOLD
SOLUTIONS

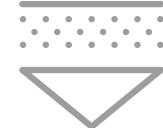

Edition 6

PVC (KG) PIPES

For domestic & street sewage systems

BELOW GROUND

The pipes for domestic and street sewerage systems together with the appropriate coupling sleeves are intended to be used for the removal of all kinds of waste water.

Assembly of the pipeline is extremely easy , pipes are connected to one another with fittings while complete seal is achieved with use of rubber bands. Maximum temperature of application is +600 °C. Pipes are resistant to salt water, alcohol, acids, alkalis, sulphates, aggressive gas and all kinds of detergents. On the other hand, they cannot be used for the transport of water which contains high percentage of benzene, benzine (petrol) or acetone.

Technical data & characteristics

- Very light material
- Simple and easy way of both transport and manipulation
- Fast and cheap assembling
- Pipe connections are resistant to water and other type of fluids
- They are resistant to corrosion in alkaline, acid or aggressive environment
- They are fine electrical insulator, and also resistant to mechanical impact
- Guaranteed life time of more than 50 years
- Practically no costs of pipeline maintenance
- Connection with muffs and gaskets made of EPDM or rubber (EN 681)
- SRPS EN 1401 / SRPS EN 13476*

*SRPS EN 1401 - European norm for production of full wall compact PVC pipes. SRPS EN 13476 - European norm for production of three layer PVC pipes.

Material characteristics:

- Specific mass 1,38 ÷ 1,45gr/cm³
- Tensile strenght 50-60 MPa
- Thermal stability: according to Vicat min 79 °C
- Thermal conductivity 0,54 KJ/mh/°C
- Linear ratio of thermal extension 0,08 mm/m/°C
- Water absorption 4 mg/cm²

APPLICATION AND STATIC RECOMENDATION

What pipe series should be used depends on location, ground quality and type of foundation, other various conditions, etc.

Pipe series S-20 and S-16 are used in normal conditions, i.e. for normal type of ground, trenches, burial methods and ground compression.

Pipe series S-25 are laid in terrains with extremely incoherent material. Deformation of the cross section is checked after one to three months from laying of pipeline.

With pipe series S-20 and S-16 deformation cannot be higher than 5% of outer pipe diameter, while the maximum deformation after two years cannot be higher than 10% of diameter.

With pipe series S-25, after one to three months from laying of pipeline, maximum deformation will not be higher than 5%, while deformation after 2 years is allowed to be up to 8%.

Laying of sewerage pipes and fittings is allowed without any specific static evidence, and in accordance with the following conditions:

- Below traffic surfaces with traffic loading up to 30 tons, minimum covering layer should be 1,5 m.

- Below non-traffic surfaces or surfaces which are temporarily exposed to light vehicle traffic, minimum covering layer should be 0,8m.
- While laying the pipeline below the buildings, covering layer above the pipe socket must be at least 150mm.
- Protection pipes should be used if the loading from the mounted construction parts cannot be avoided.
- While laying the pipeline in the trenches with minimum width, covering layer must not be higher than 6m; on the other hand, while laying the pipeline below the protective dam and in wide trenches, covering layer should not be higher than 4m.
- Filling soil should have the following approximate characteristics: $8 \leq 20,5 \text{KN/m}^2$ $8 \leq 22,50$ (angle \emptyset)
- Laying the pipeline in the area with ground water is allowed only if the removal of the filling material is prevented. Removal is prevented by laying the pipeline in the filter layer made of gravel or concrete.
- If not acting completely in accordance with these norms it is necessary to calculate the pipe

carrying ability, while standard conditions of filling and ground compression should be provided (DIN 4033, EN 124); this means that in the pipeline zone, from the bottom of the trench up to at least 30cm above the vertex of the pipe the following ground compression values should be achieved:
• 97% density of un shoveled soil for binding ground.
• 95% density of unshoveled soil for binding ground.

All values of ground compression should be proven during handling.

- Pipeline zone (from the bottom of the trench up to at least 30cm above the vertex of the pipe) is filled with material which does not contain stones and at the same time can be compressed. Filling material, which will be in direct contact with the pipe, can be taken from the ground pile came from shoveled trench, which should be previously cleared from large pieces. Ground compression around the pipe can be done manually or by using hydraulic tools. Each time material is filled only up to vertex of the pipe while the ground compression is being done sidewise, never in the zone occupied by the pipe. Filling material is being compressed until well sidewise support of the sewerage trench is provided. Material is being filled above the vertex of the pipe in layers, in a way that the higher layers are compressing the lower ones.

PIPE SERIES SPECIFICATION

Pipe series S-25 (SDR 51) SN 2 KN/m

- Depth of pipe trench min 1,2 ÷ 4 m max
- Maximum loading max 12t/axel
- Ring stiffness SN 2 KN/m²
- Connection with EPDM or rubber (EN 681) seal in socket
- Length 1 ÷ 6m

Pipe series S-20 (SDR 41) SN 4 KN/m²

- Depth of pipe trench min 1,2 ÷ 6 m max
- Maximum loading max 18t/axel
- Ring stiffness SN 4 KN/m²
- Connection with EPDM or rubber (EN 681) seal in socket
- Length 1 ÷ 6m

Pipe series S-16 (SDR 34) SN 8 KN/m²

- Depth of pipe trench min 1,2 ÷ 6 m max
- Maximum loading max 18t/axel
- Ring stiffness SN 8 KN/m²
- Connection with EPDM or rubber (EN 681) seal in socket
- Length 1 ÷ 6 m

FITTING OF SN4 CLASS CAN BE USED WITH PIPES SN8,
BECAUSE OF THEIR GEOMETRY THEY HAVE STRENGHT OF SN8.

SADDLE AFTER GRIP (SAG)

Saddle after grip is new, modern product, with great performance.

It is intended for subsequent connection to an existing pipeline for smooth as well as corrugated pipes. Using this system, combined with a great range of Peštan fittings, production of new lines of home, street and drain sewer, as well as connecting to existing lines becomes satisfaction.

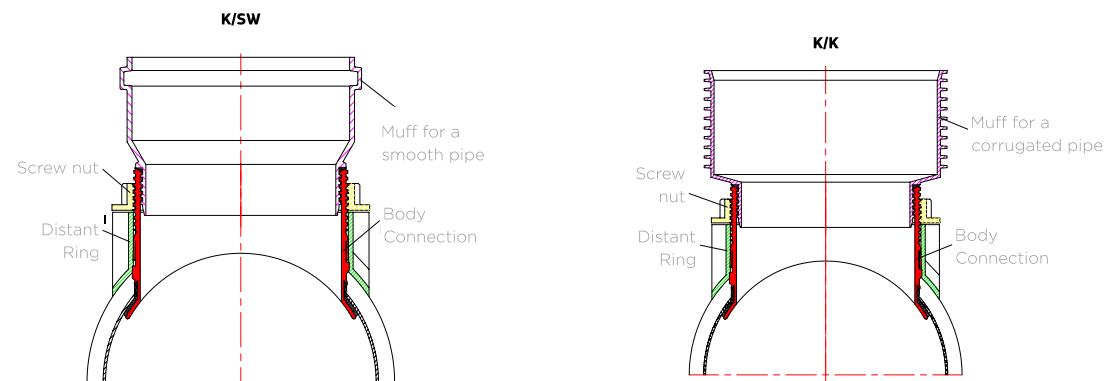

Peštan latest product main purpose is to be subsequently attached to an existing pipeline with a connection to smooth and corrugated pipes. The connection is safe and waterproof. It is made of ABS by injection molding technology.

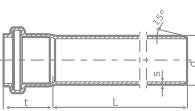

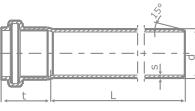

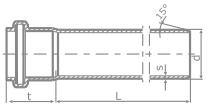

SIZES

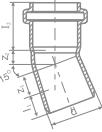

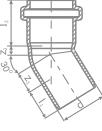

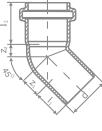

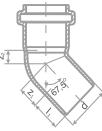

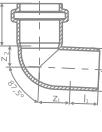

Sizes are given in the following table:

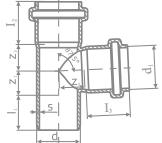

K/K CODE	K/SW CODE	
10799210	10799110	250/160

BRAND MANIFESTO

We do not only sell pipes, we combine reliability with quality for the ultimate benefit of our clients.

We do not build short-term client relationships, but long-term and genuine partnerships.

Everything we do, we do with one thing in mind - to create ideas to perfectly match all our client needs and the best way for us to achieve this goal is to constantly educate our clients provide solutions that meet their specific needs and support them throughout the entire process.

Because our success is as big as your trust in us.
